CODEDECODE

Event co-ordinators: Mayuresh Desai, Satyam Jha

Faculty co-ordinators:

Event Description:

CODE-DECODE is a thrilling coding competition designed for students to test and showcase their problem-solving skills. Participants will tackle three challenges: two medium-level and one easy-level coding problem. The event encourages creative problem-solving, efficient code writing, and the ability to work under pressure

- Number of Problems: 4 Coding Problems

- 2 Easy

- 2 Medium

- Duration: 90 minutes

- Team Size: Individual participation

- Platform: Conducted on a competitive coding platform like Leet code, Code Chef, Code forces, or Hacker Rank.

Rules:

1.Languages:

Participants may use any programming language supported by the platform (e.g., Python, C++, Java, etc.).

2.Problem Submission:

Each problem will have test cases, and participants are required to submit their solutions within the given timeframe. Submissions will be judged based on how well the code handles the provided test cases.

3.Scoring System:

- Each problem will be assigned a score (Easy: 100 points, Medium: 200 points each).
- Points are awarded based on the correctness of the code (i.e., passing all test cases).
- Partial scores will be given for passing some but not all test cases.

TECHNOKRUTI

4. Code of Conduct:

- All submissions must be the participant's own work. Any form of plagiarism or unethical behavior will result in immediate disqualification.
- Participants may not communicate with others outside their team during the competition.

5. Tie-Breaker:

In case of a tie, the winner will be decided based on:

- The team with the fastest submission time across all solved problems.
- If the tie persists, the number of incorrect submissions will be considered or Space and Time complexity of their solutions.

Judging Criteria:

1. Correctness:

- Solutions will be evaluated based on how well they pass the provided test cases. Full points will be awarded only if the solution passes all cases.

2. Efficiency:

- The time complexity and space complexity of the submitted code will be considered. Codes that solve the problem in a more optimized manner (with fewer resources) will receive higher marks.

3. Code Quality:

- Well-structured, readable code with proper comments and variable names will be favored. This will not carry as much weight as correctness but can help in the event of a tie.
